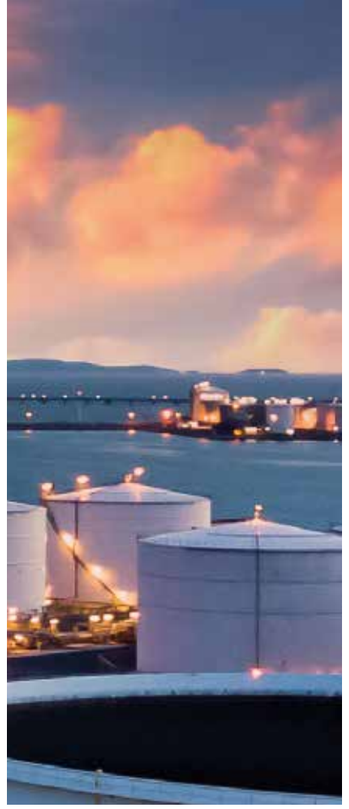
Composites

Chemical containment

Corrosion resistant resins for chemical containment and piping

SCOTT BADER

*Making a **positive** difference*



CONTENTS

HIGH PERFORMANCE CHEMICAL CONTAINMENT

For chemicals to consistently achieve maximum performance and meet applicable safety standards, they must be held in high quality containers. Scott Bader offers an outstanding range of corrosion resistant, chemical grade high performance unsaturated polyester and vinyl ester resins that are suitable for the manufacture of glass reinforced polyester (GRP) tanks and pipes for acids, alkalis, fuels, foodstuffs, wine, water and other demanding materials.

Our Crystic® chemical grade resins have been used to make a wide variety of GRP components for the transfer and containment of chemicals. For over 60 years Scott Bader customers have confidently used Crystic® resins in demanding chemical environments where long-term resistance to heat and chemical attack is essential.

GRP applications

Crystic® chemical grade resins are typically used to manufacture the following containers for transfer and storage:

- Storage tanks
- Piping
- Ducts
- Scrubbers
- Containers
- Chemical plants
- Sewage and water treatment plants

Chemicals handled

GRP tanks, containers and pipes are ideally suited for the safe, reliable storage and transfer of a wide range of demanding materials, including:

- Corrosive chemicals
- Fuels
- Potable water
- Effluents and contaminated liquids
- Wine
- Sewage
- Agricultural waste
- Animal feeds
- Foodstuffs

Benefits of using GRP

As well as being resilient and safe, Crystic® polyester GRP components offer further added benefits:

- Lightweight, strong, tough composite structure
- Low maintenance
- Easy to clean using a high-pressure hose
- Repair work can be carried out in-situ, fast and cost effectively
- On-site system modifications are often feasible

PIPES AND PIPE LININGS

Much of the early development of GRP pipes was for applications in chemical plants, and has led to Scott Bader supplying polyester resins to GRP pipe and pipe liner manufacturers for over 50 years.

Developing specialist filament winding and centrifugal casting techniques enables our customers to produce lightweight, low maintenance GRP pipes efficiently and effectively.

Crystic® resins and gelcoats

A complete range of proven Crystic® products is offered for piping and lining applications including isophthalic and vinyl ester resins for sewage and water carrying pipes.

Major GRP pipe applications

- Chemical plant pipework
- Underground piping
- Above ground pressure pipes
- Sewage piping
- Potable water distribution

Trenchless pipe repairs with GRP liners

We offer two options for in-situ pipe repair work that are proven worldwide, and both ensure cost and disruption are kept to a minimum whilst essential repair work is carried out.

1. Cured-in-place GRP liner

The liner is placed inside a damaged pipe then expanded to fit the existing pipe and simultaneously cured by circulating hot water.

2. Pre-fabricated GRP slip liner

Used to line 'live' piping systems for immediate and effective repair.

Scott Bader's long association with the GRP pipe and pipe lining markets has seen us develop an unrivalled technical expertise and range of products for the GRP pipe industry. Our customers value the peace of mind this gives them and the competitive advantage for their business.

Pipe jointing

This can be carried out using spigot and socket systems with gaskets. Polyester resin collars can easily be cast onto pipe ends and machined to the appropriate dimensions.

Resilient polyester resins containing a high loading of filler - such as ground silica flour - can be cold cured extremely rapidly and prove to be ideal for casting pipe collars. Pipes can also be butted together and joined using an overlay GRP joint, wet laminated on site.

We also offer a number of bonding solutions for pipe jointing through our Crestabond®, Crestafix® and Crestomer® adhesives. Please contact our Technical Support Department for further guidance.

RESISTANCE PROPERTIES AND PERFORMANCE

Crystic® resins are carefully formulated to offer the specifier excellent chemical resistance combined with good mechanical properties at a competitive price. They give the moulder the greatest advantages in ease-of-use and mould turn-round whilst maintaining their excellent properties.

"We have used Scott Bader resins, including Crystic® 397PA almost exclusively for the past 50 years. We have used Crystic® 397PA for many arduous chemical storage applications with great long term success."

Forbes Technologies Ltd, the U.K's leading manufacturer of chemical storage tanks.

THE RANGE OF CORROSION RESISTANT RESINS

Crystic® 196
Orthophthalic polyester resin for laminates with low taint and good resistance to non-alkaline conditions.

Crystic® 197
A higher temperature resistant modification of Crystic® 196 for use in warm climates. WRAS approval as Crystic® 197M.

Crystic® 198
Orthophthalic polyester resin with high heat resistance.

Crystic® 199
Isophthalic polyester resin for laminates requiring very high heat resistance.

Crystic® 272
Low viscosity, isophthalic polyester resin capable of producing high performance laminates with low taint. Recommended for filament winding processes. WRAS approval as 272E.

Crystic® 274
A higher temperature resistant modification of Crystic® 272 for use in warm climates. WRAS approval as Crystic® 274E.

Crystic® 392
Isophthalic-NPG polyester resin for strong, durable laminates with exceptional resistance to a wide range of chemicals. Gives good adhesion to uPVC liners.

Crystic® 397PA
Thixotropic, pre-accelerated isophthalic-NPG polyester resin producing laminates with low taint and excellent resistance to a wide range of chemicals. Gives good adhesion to uPVC liners. WRAS approved.

Crystic® 474PA
Pre-accelerated, thixotropic version of Crystic® 198. WRAS approved.

Crystic® 491PA
Pre-accelerated, thixotropic version of Crystic® 272. WRAS approval as Crystic® 491 EPA (ME) with Crystic® Gelcoat 65PA.

VE 671
Quick curing vinyl ester resin with outstanding chemical resistance to a wide range of substances at room and elevated temperatures. Suitable for all conventional techniques, epoxy bisphenol type, non-accelerated and non-thixotropic. High reactivity.

VE 673
A vinyl ester resin based on epoxy novolac with excellent solvent, general chemical and thermal resistance.

VE 676
A vinyl ester resin based on epoxy Bisphenol A for the manufacture of components with excellent chemical and thermal resistance.

VE 660
Vinyl ester based resin designed for use in tropical climates. Typically for manufacture of pipes and tanks.

VE 661
Vinyl ester based resin with good chemical resistance to a wide range of substances at room temperature and elevated temperatures.

Contact your local Scott Bader representative to check product availability in your region (see back page for details).

FINDING THE RIGHT GRP PRODUCT FOR THE JOB

You will want to be sure that you are using a GRP product that offers the right level of resistance to a specific chemical or mixtures of chemicals, in balance with it also being the most cost-effective solution.

The information presented opposite is the recommended Crystic® resins, ranging from orthophthalic polyester resins (which have good resistance to acidic conditions) to the improved resistance of isophthalic polyester resins. Also available are the more sophisticated and expensive bisphenol modified resins and vinyl ester resins, which are designed for exceptional all-round chemical resistance. These resins are listed in Table I. Table II covers a wide range of chemicals and presents the maximum operating temperature in °C for laminates made as recommended on page 10, with these Crystic® resins, under the chemical groups listed below.

Inorganic Chemicals

1.1 Acids (mineral)
1.2 Alkalies
1.3 Hypochlorites
1.4 Plating solutions
1.5 Miscellaneous inorganic chemicals
1.6 Salt solutions
1.7 Water

Organic Chemicals

1.8 Acids (organic)
1.9 Alcohols/glycols
1.10 Foodstuffs/edible oils
1.11 Fuels/oils
1.12 Miscellaneous organic chemicals to which GRP is resistant
1.13 Miscellaneous organic chemicals to which GRP is generally not resistant
1.14 Fire extinguisher foams
1.15 Surfactants

Within each chemical group, the chemicals are listed in alphabetical order and where possible the Maximum Operating Temperature for fully post cured material is given.

BACKGROUND TO THE MAXIMUM OPERATING TEMPERATURES

The Maximum Operating Temperatures for chemical-resistant Crystic® resin laminates in various environments have been determined from a number of sources including case histories, laboratory tests and practical experience in various parts of the world.

Provided that the GRP structure is manufactured to high standards and in the case of chemical tanks, designed in accordance with the requirements of BS 4994:1987 with full post-cure, the design life period will be ensured.

Some GRP tanks made with Crystic® polyester resin have already operated for over 12 years within our recommended temperature limits.

Guidelines to assist in the design of GRP components using the 'K' factor of safety approach used in BS 4994 are presented on page 12. BS 4994:1987 provides options other than full post-curing, which are linked to the factor of safety k_5. However, in critical environments our recommended curing procedures at elevated temperatures should be obtained from our Technical Support Department.

The given Maximum Operating Temperatures apply to GRP mouldings and not GRP liners used in the protection of metal, concrete and other materials. GRP linings will extend the life of many materials but the Maximum Operating Temperature of the GRP lining should not exceed 60°C because of factors such as differential thermal expansion and the inability to post-cure effectively and completely.

RECOMMENDATIONS FOR CHEMICAL RESISTANT LAMINATES

Assessment of the evidence over several decades shows that the following factors together are particularly important in achieving maximum resistance of glass reinforced polyester laminates operating in chemical environments.

- Matched fully formulated barrier layer and structural resin system
- Complete wetting-out of the reinforcement
- Minimum void content in barrier layer and laminate
- Reinforcement with non-hydrolysable binder
- Fabrication under optimum workshop conditions and post-curing at our recommended elevated temperatures
- Use of recommended thickness of barrier layer*
- Reinforcement not pressed too close to the surface
- Sufficient protection of the back of the laminate to be resistant to splashes

Barrier layers can consist of either a thermoplastic liner, or a GRP barrier layer of 3-4mm thick made up of C glass surface tissue or a suitable synthetic tissue reinforced with chopped strand mat at a high resin:glass ratio.

To be confident in the chemical resistance of glass reinforced laminates in contact with chemical environments follow the complete recommendations above including the specification of a matched Crystic® barrier layer resin and a Crystic® chemically resistant structural resin.

Acid environments

In acid environments it is important to ensure that the structural laminate is adequately protected from the environment by a substantial barrier layer. This can consist of either a thermoplastic liner or a GRP barrier layer several millimeters thick made up of C glass surface tissue and chopped strand glass mat at a high resin: glass ratio. GRP in acid environments can suffer premature degradation as a result of the stress corrosion cracking of glassfibre reinforcement. It is therefore necessary that the recommended barrier layer be backed with the appropriate Crystic® resin, as listed, reinforced with an acid resistant glass e.g., ECR (Extra Chemical Resistant).

Post-curing

Post-curing recommendations for some resins are contained in individual technical leaflets or, if not, they should be obtained from our Technical Support Department. If the proposed operating temperature is above 80°C then the laminate must receive, in addition to the general recommended post cure mentioned, a further minimum post-cure of at least three hours at 100°C or at the design working temperature, whichever is the greater. The entire laminate must be immersed in hot air, which is controlled at the recommended temperature.

Potable water, wine and foodstuffs

Selected Crystic® resins are recommended for use with the above and have been approved to the requirements of various authorities. Post-curing requirements are important. In these and all critical environments, specific recommendations about curing and post-curing procedures must be obtained from our Technical Support Department.

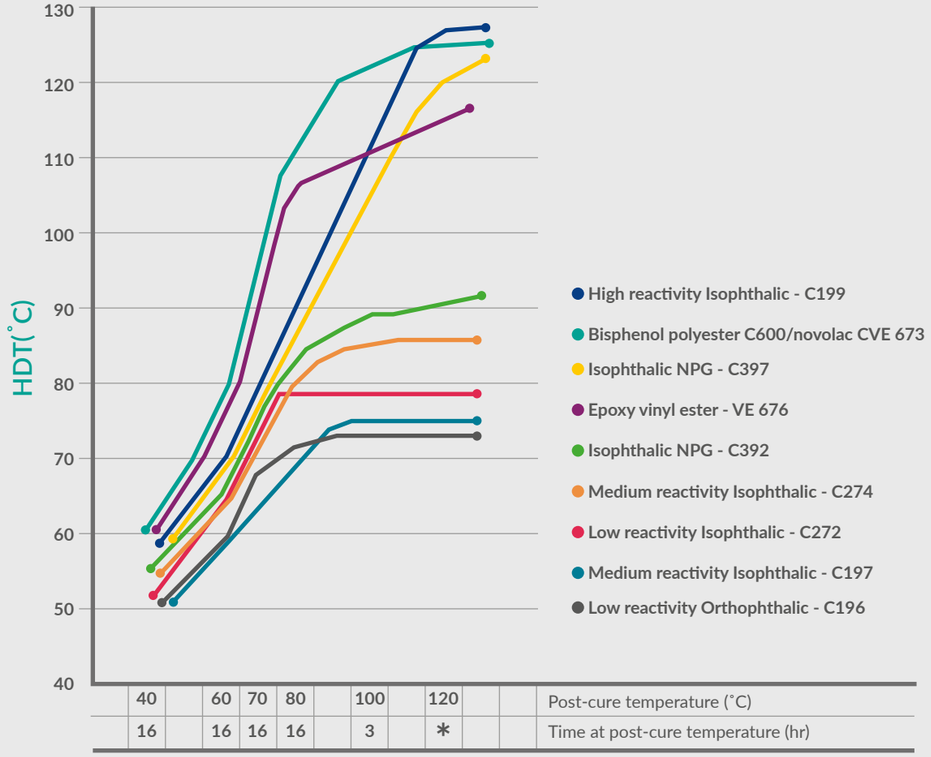
Variation of HDT of cast polyester resin with post-cure temperature

Barcol hardness is generally used as an indication of the degree of cure of the laminate but this is not sensitive enough to assess the level of cure for chemical or food storage applications.

A laminate cured at room temperature or 40°C, for example, will achieve an acceptable Barcol hardness for most applications. However, the Heat Distortion Temperature (HDT) and the degree of cross linking within the polymer will, generally, be below the level required for safe chemical containment.

16hr at 40°C has been shown to give the same level of post cure as 28 days at room temperature (20°C) and reference to the graph below shows that this results in HDT's of only 50-65°C, depending upon the resin type. The use of higher post-cure temperatures leads to a higher percentage of the material's HDT (and chemical resistance) being achieved.

HDT level by post cure temperature



40		60	70	80		100		120	Post-cure temperature (˚C)
16		16	16	16		3		*	Time at post-cure temperature (hr)

*Scott Bader post-cure
5 hours at 80˚C followed by 3 hours at 120˚C

DESIGNING WITH ‘k’ FACTORS

To assist in the design of components utilising the K factor approach used in BS 4994:1987, it is proposed that the following guidelines be adopted in interpreting Maximum Operating Temperature data in terms of the k_2 factor and the k_5 factor (relating to post-cure conditions). These factors are then multiplied together and used with other factors defined in BS 4994 to obtain the overall factor of safety, K.

Relationship between recommended Maximum Operating Temperature (t_m) and Factor k_2	
Temperature of use	k_2
t_m	1.4
10°C below t_m	1.4
20°C below t_m	1.3
30°C below t_m	1.3
40°C below t_m	1.2
50°C below t_m	1.2
60°C below t_m	1.1
70°C below t_m	1.1

Relationship between the effect of post-curing (as determined by Heat Deflection Temperature measurement) and Factor k_5	
Post Cure temperature (for 6 hours)	k_5
At the quoted Heat Deflection Temperature (HDT)**	1.0
10°C below quoted HDT**	1.0
20°C below quoted HDT**	1.2
30°C below quoted HDT**	1.4
40°C below quoted HDT**	1.8

t_m is the recommended Maximum Operating Temperature for the fully oven* cured resin (as shown in Table 2 of this booklet). When k_2 = 1.2, BS 4994 assumes that the strength is >80% of the original ultimate tensile strength.

If the loss in strength is >50%, BS 4994 states that the material is unsuitable for total confidence in assessing the level of k_2. For chemicals aggressive to GRP full oven* post-cure to our recommendations is essential.

It is recommended that Appendix E of BS 4994:1987 is consulted to assist in the determination of k_2.

At concentrations and use at a Maximum Operating Temperature well below those shown in Table 2, where post-curing at elevated temperatures may not be necessary, then k_5 = 1.0.

If post-curing is carried out at 100°C or above, then k_5 = 1.0.

In very aggressive environments, even at low operating temperatures, high temperature post-cure is essential to achieve cost-effective reinforced structures for chemical plant applications (see BS4994:1987, Section 2 Part 9.2.2.(e)).

If a thermoplastic lining is used which is chemically resistant to the specific conditions, then, in all cases, k_2 = 1.1 and k_5 = 1.0.

* Total immersion in hot air, controlled at the recommended temperature.

** See Table 1 overleaf

TABLE 1

CRYSTIC® RESINS RECOMMENDED FOR SAFE CHEMICAL CONTAINMENT

CRYSTIC® ORTHOPHTHALIC POLYESTER RESINS		Post cured* HDT (1.8 MPA stress)
196	Good resistance to acidic conditions, low taint.	72°C
197	Higher temperature resistant C196 type resin.	77°C
198	High heat resistance.	110°C
474PA	Thixotropic pre-accelerated version of Crystic® 198.	110°C
CRYSTIC® ISOPHTHALIC POLYESTER RESINS		**Post-cured* HDT**
272	Low viscosity, high performance resin with low taint. (Particularly suitable for filament winding).	75°C
491PA	Thixotropic pre-accelerated version of Crystic® 272.	75°C
274	Higher temperature resistant C272 type resin.	84°C
199	Very high heat resistance.	130°C
CRYSTIC® ISOPHTHALIC-NPG POLYESTER RESINS**		
392	Tough with exceptional resistance to a wide range of chemicals. Good adhesion to uPVC liners.	90°C
397PA	Thixotropic heat resistant resin, with exceptional resistance to a wide range of chemicals and elevated temperatures. Low taint. Good adhesion to uPVC liners.	125°C
CRYSTIC® BISPHENOL POLYESTER RESIN		
C600E/C600PA	Propoxylated bisphenol A modified unsaturated polyester resin.	120°C
CRYSTIC® EPOXY-MODIFIED VINYL ESTER RESINS		
VE660	Based on epoxy bisphenol A, chemical resistance and thermal resistance	95°C
VE 661	Based on epoxy bisphenol A, good chemical resistance and thermal resistance.	100°C
VE 671	Based on epoxy bisphenol A, excellent chemical and thermal resistance.	100°C
VE 676	Based on epoxy bisphenol A, excellent chemical and thermal resistance.	95°C
VE 673	Based on epoxy novolac, very good chemical resistance and good thermal resistance.	130°C

*Cast resin specimens cured for 24 hours at 20°C, followed by 5 hours at 80°C and 3 hours at 120°C, tested to BS 2782.

**NPG denotes that neopentyl glycol has been used in the formulation. This is a symmetrical glycol allowing a close-knit molecular structure which resists chemical attack.

MAXIMUM OPERATING TEMPERATURES IN °C FOR CHEMICAL RESISTANT FRP LAMINATES FULLY POST-CURED AT ELEVATED TEMPERATURE AND PRODUCED ACCORDING TO THE RECOMMENDATIONS IN OUR DATA SHEETS.

Butyl amine	100	NR	NR	NR	NR	NR	NR	NR	NR	NR	NR	NR

1. A resistant veil such as saturated polyester should be used in the surface in contact with this chemical, in place of glass.
2. A resistant veil such as polyacrylonitrile should be used in the surface in contact with this chemical, in place of glass.
∗ Use polypropylene liner.
NR = Not recommended
NA = Data not available
▲ Concentrations (by weight unless otherwise stated) prepared according to ISO/R175 where relevant.

PLATING SOLUTIONS - EXPLANATORY NOTES

The following plating solutions have been used in Section 1.4. If the solutions to be used differ in composition then advice should be sought from our Technical Support Department.

HEAVY PLATE SOLUTION	% by weight
Hydrochloric acid (conc)	7
Hydrochloric acid (conc)	24
Water	69

PLATING SOLUTIONS	% by weight
GOLD	
Potassium ferrocyanide	22.8
Potassium gold cyanide	0.2
Sodium cyanide	0.8
Water	76.2
PLATINIUM	
Manufacturers recipe (Sulphato dinitritoplatinous acid)	100

PLATING SOLUTIONS	% by weight
CADMIUM	
Cadmium oxide	3.2
Sodium cyanide	9.5
Caustic soda	1.2
Water	86.1
CHROME	
Chromic acid	18.5
Sodium fluosilicate	0.62
Sodium sulphate	0.01
Water	80.87
LEAD	
Lead	8.0
Flourboric acid	0.8
Boric acid	0.4
Water	90.8

	% by weight
NICKEL	
Nickel sulphate	11.3
Nickel chloride	1.4
Boric acid	1.1
Water	86.2
SILVER	
Silver cyanide	3.9
Potassium cyanide	6.5
Potassium carbonate	1.6
Sodium cyanide	4.5
Water	83.5
